

Table. Results of multiple logistic regression analysis using inverse probability of treatment weighting in a binary logistic regression analysis with a generalised estimating equation approach for in-hospital mortality in all patients who underwent aortic repair for ruptured aortic aneurysm (n=5,306)

Variable	IPTW		
	Odds ratio	95% CI	<i>P</i> value
<b>EVAR</b> (reference: Open group)	<b>0.74</b>	<b>0.60-0.92</b>	<0.01

Abbreviations: CI, confidence intervals; IPTW, inverse probability of treatment weighting; EVAR, endovascular aortic repair
